

Multiple choice questions:

1. Which expert has a different view from the others regarding the timescale of AI becoming more autonomous? → **B**
2. Which expert has a similar view to A about the responsibility humans have for the future of AI? → **D**
3. Which expert agrees with B that the negative aspects of AI far outweigh the positive aspects? → **D**
4. Which expert seems to disagree with B about how fast humans can change? → **C**
5. Which expert gives their opinion about what will happen with the same level of certainty as D? → **B**

Answer the question. Do you see robots as friends or foe?

I find robots to have far more advantages than drawbacks as long as we use them in the right way. After all, robots will do as much as we let them do, whether by reasons of design alone, like an arm robot that can only grab and assemble pieces in a factory line, which can only remain fixed in the position where he has been bolted and connected to, or by the programming rules we implement in their software if they have the ability to process the data they collect from their environment.

Given this situation they are incredible tools, for they can do repetitive and complex tasks in a constant way unattainable by humans, being able to, for example, produce thousands of the exact same piece for an engine, in the exact same time for each, with minimum defects and much more efficiently than any human worker. They don't just reduce the workload effectively, but can also be used to perform dangerous tasks that otherwise would put human lives at risk, like working with high-voltage equipment, or in toxic environments.

This is why I find robots to be our friends, and if I was to find any reason to see them as a threat, it would probably have more to do with the use and purpose we humans were giving to them, rather than what they are able to do on their own.
